

TEKNIC EUCHNER

Inductive Proximity Switches

TEKNIC EUCHNER is a joint venture between EUCHNER Germany and TEKNIC India. EUCHNER was founded in 1940 and TEKNIC in 1970. EUCHNER has been a pioneer in the field of multiple position switches. As early as 1952, the world's first multiple limit switch was produced by EUCHNER.

TEKNIC was started in 1970 and has pioneered the development of high quality electromechanical products ever since 1980. The joint venture TEKNIC EUCHNER was approved by the Government of India in 1989. The joint venture TEKNIC EUCHNER ELECTRONICS PVT LTD, established in Bangalore, with technology transfer from EUCHNER Germany, has started manufacturing a product range to start with inductive proximity switches, single and multiple limit switches with the intention to produce the full range of EUCHNER products. The buzzword is reliability, precision and quality backed by continual testing and maintenance of high quality with the aid of computer controlled inspection systems. The manufacturing facilities of TEKNIC EUCHNER are backed by a competent marketing set up and committed selling partners.

Built for extreme conditions

The TEKNIC EUCHNER Inductive Proximity Switches are solid state switching devices which require no physical contact to actuate them.

Used for control and positioning signals, they can be connected directly into conventional or electronic control systems. The need for such switching devices has increased in recent times as manufacturing plants, as well as machines in general have become more automated. The combination of high quality materials and advanced technology in the construction of these switches ensures a very high degree of precision and reliability under the most arduous conditions.

The main advantages for inductive proximity switches are :

- exceptionally **long life** and **high switching speeds** (up to 5 million per hour) ;
- no-touch, zero, operation force** (no actuator or plunger required) ;
- wear and maintenance free operation** (solid state, no moving parts) ;
- bounce free signals** (no spurious signals through contact bounce) ;
- reliable switching under extreme conditions.**

Fully waterproof (insensitive to strong vibrations, dirty environments, rapid temperature changes).

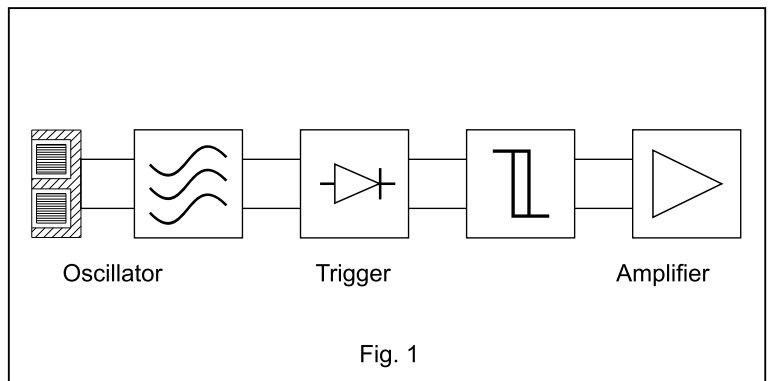

The following details in this catalogue include all dimensional and technical data describing in detail all the most interesting features of the TEKNIC EUCHNER range of inductive proximity switches. Please note for special applications TEKNIC EUCHNER are willing to develop switches to customer specifications subject to economical batch quantities.

**The Switch Concept.
Design, Function and Definitions.**

Design and Function. : The electronic Inductive Proximity switch comprises of three principle Parts :

- 1) The oscillator. 2) A trigger stage and 3) amplifier stage (see figure 1)

The Oscillator generates, with its coil, a high frequency electromagnetic field of approximately spherical distribution. Any metallic object introduced into this field absorbs energy from the oscillator by induced eddy currents. This reduces the amplitude of the oscillations and this change triggers the out put stage. **This type of oscillator will respond to any type of metal.**

Definitions :

Sensing Face. : The sensing face of an inductive proximity switch is the surface from which the electromagnetic field radiates. The sensing faces of the TEKNIC EUCHNER inductive proximity switches are clearly marked with a system of colours or rings.

Sensing Distances.

The **sensing distance** is the maximum distance between the target and the sensing face to be sure of obtaining a switching signal. This distance is measured using a square mild steel (St 37) target 1 mm in thickness. The sides of the square target should be equal to the diameter of the sensing face of the inductive proximity switch (EN 50 010).

The **Nominal sensing distance S_n** is a reference dimension only and does not take into account temperature or voltage variations.

The **Effective sensing distance S_r** is the distance measured at nominal voltage and ambient temperature. ($0.9 S_n \leq S_r \leq 1.1 S_n$)

The **Usable sensing distance S** measured within a given voltage and temperature range. ($0.9 S_r \leq S \leq 1.1 S_r$)

The **Working sensing distance** is every sensing distance which guarantees operation under given temperature and voltage conditions. This distance can be selected between 0 and the usable sensing distance.

Reduction Factor.

If the target of the inductive proximity switch is manufactured from a material other than mild steel (St 37) or if the target varies in thickness and area from the standard target, then the sensing distance will vary.

Material	Reduction Factor
Steel (St.37)	1.0
Brass	0.35...0.5
Copper	0.25...0.45
Aluminium	0.35...0.5
Stainless Steel	0.60...1.0

Repeat Accuracy.

The repeat accuracy is the reproduction accuracy between two successive operations under the same ambient conditions.

Switch Hysteresis.

The Switch hysteresis is the difference between the switch ON point, when the target approaches the sensing face of the inductive proximity switch and the switch OFF point, when the target moves away from the sensing face. (see fig.3). The graphs shown in figure 4 indicate the Switch ON and Switch OFF points of various switches when the target approaches the switch in a radial direction in relation with the axial distance of the target from the sensing face.

Temperature Drift.

The temperature drift is the change in switch point in m/K due to variations in ambient temperature conditions when all other conditions remain constant.

Installation.

The TEKNIC EUCHNER inductive proximity switches are suitable for **flush fitting** or **non-flush fitting**.

Flush Fitting. Inductive proximity switches intended for flush fitting are not affected by surrounding metal and can be installed immediately adjacent to metal surfaces. (see figure 5)

Non-flush fitting. Inductive proximity switches not intended for flush fitting can be affected by surrounding metal surfaces and must be installed with a metal free zone or non-damping material adjacent to the sensing face. (see figure 6)

Important Fitting Instructions.

Inductive proximity switches with threaded housings are clamped in position using two nuts. If these nuts are over tightened it is possible to damage the switch housing.

For this reason care should be taken that tightening torques mentioned below should not be exceeded.

Models	Max. Tightening Torque (Nm)
EGT08	12
EGT12	28
EGT18	40
EGT30	40

**The Inductive Proximity Switch in Practice
Electrical Characteristics.**

Voltages.

The TEKNIC EUCHNER inductive proximity switches are designed for AC or DC operation. Refer to technical data in this catalogue for specific details of voltages ranges for the individual switch types.

The operating voltage is the voltage which can be used to operate the inductive proximity switch.

Note : Two wire proximity switches must only be used in series with the load.

Fig. 3

Fig. 4

Fig. 5

Fig. 6

The **Voltage Drop** U_d is the voltage measured between the energized output and the switched potential at the rated current I_a of the switch

Ripple voltage.

The ripple voltage is the AC voltage U_{br} (peak to peak) superimposed on the mean DC voltage U expressed as a percentage. (see figure 7) The provision of smooth DC supply within 10% (to DIN 41755) maximum ripple is absolutely essential for effective operation DC switches. When using a single phase rectified supply the appropriate smoothing capacitor should be used.

$$U_{br}/U.100 \text{ [%]}$$

Fig. 7

Currents.

The **Load Current** I_a is the maximum current at which the inductive proximity switch can be continuously operated.

The **Inrush Current** I_k is the maximum current which can flow, from the moment that the switch is on, for a specified time.

The **No-load Current** is the current consumed by the switch at the maximum operating voltage without there being any external load current.

The **Residual Current** I_r is the current which flows through the load even when the switch is in its blocked state. In practice this is only to be considered for two wire switches.

Holding Current I_H is the least current necessary to ensure correct functioning of an actuated 2 Wire switch.

Switch frequency.

The Switch frequency is the maximum number of switching functions per second. The method of measurement must conform to EN 50010. Refer to the technical data in this catalogue which indicates the maximum switching frequencies for each individual type of switch.

The methods of protection.

The TEKNIC EUCHNER inductive proximity switches have an environmental protection to IP67 to DIN 40050. The following methods protection ensure particularly reliable operation for all users of TEKNIC EUCHNER inductive proximity switches.

The short circuit protection. Switches with built-in short circuit and overload protection are protected against damage to the output stage. Pulsed short circuit protection is used in which the output transistor is switched OFF and ON in quick succession. This enables the switch to function normally on removal of the short circuit condition.

Reverse polarity protection. The inductive proximity switches are protected against damage due to inverted supply line connection.

The transient voltage protection. The TEKNIC EUCHNER inductive proximity switches are protection against damage caused by supply line transient voltages. In order to prevent unusually high transient voltages which can destroy the switch or activate the short circuit protection, **the supply line should be separated from cables which carry high currents for motors, clutches and magnets**. If in doubt, please contact our technical personnel.

Power Supply.

The provision of a smoothed D.C. operating voltage with a maximum ripple of 10% is essential for the effective operation of D.C. proximity switches. The circuit shown in figure 8 is a suggestion for loads up to 1000mA.

Load Current (mA)	C rating in F
200	1000
500	2200
1000	4700

Fig. 8

Testing Suggestions : When testing inductive proximity switches, normal filament lamps must never be used without an additional series resistor. This is important because when a filament lamp is cold it has a very low resistance and hence a high inrush current. This can destroy the proximity switch. We recommend for testing a voltmeter or preferably an oscilloscope.

Series and Parallel Connection of Proximity Switches :

Series Connection of 3 and 4 Wire DC switches (AND Logic) : Used when it is necessary to obtain two or more corresponding signals before an action is carried out. It is necessary to take into account the voltage drop U_d present at the output of each switch which will reduce the voltage available at the load correspondingly.(see fig.9)

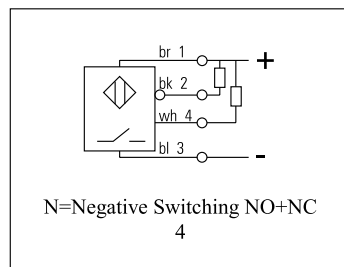

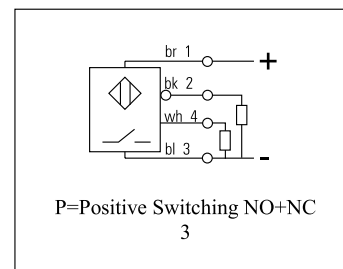

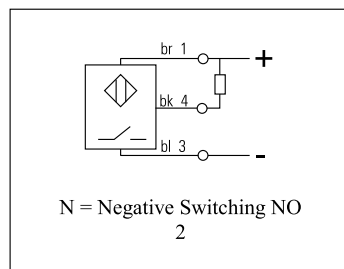

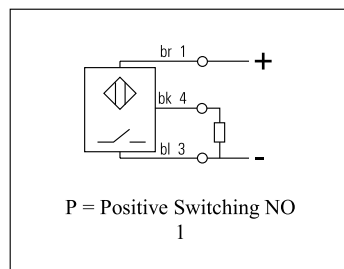

Parallel Connection of 3 and 4 Wire DC switches (OR Logic) : Used when any one of the switches are required to activate the load. (see fig.10)

Series Connection of 2 Wire AC and DC switches (AND Logic) : see note above for Series connection of 3 and 4 wire switches.(see fig.11)

Parallel Connection of 2 Wire AC and DC switches (OR Logic) : It is necessary to take into account the cumulative no-load currents of each of the switches which would flow through the Load in the unactuated condition of the switch. This could under circumstances trigger of the load without actually operating the switch.(see fig.12)

Load Current Ia (mA) max	250		250	
Residual Current Ir (mA) ≤	0.001		0.001	
No-Load Current (mA) ≤	15		15	
Voltage Drop Ud (V) ≤	2.5		2.5	
Internal Resistance Ri (KΩ)	4.7		4.7	
Temperature Drift S (µm/K) ≤	± 20		± 30	
Switching Frequency (Hz)	300		300	
Output Polarity	PNP		NPN	
Output Function	A=NO	U=NO+NC	A=NO	U=NO+NC
Connection Diagram	1	3	2	4
Short Circuit Protection	yes	yes	yes	yes
Status Indication	LED (see ordering code)		LED (see ordering code)	

Connection Plug		
	<p>Technical Data: SBF</p> <p>Indication: -</p> <p>Environmental Protection: IP67</p> <p>Output Function: NO / NO+NC</p> <p>Output Polarity: PNP / NPN</p> <p>Cable Length (mm): 2000, 5000</p> <p>Ordering Code: SBF3A-2000, SBF3A-5000, SBF4U-2000, SBF4U-5000</p> <p>SBF4 WITHOUT CABLE</p>	<p>Technical Data: SGF</p> <p>Indication: -</p> <p>Environmental Protection: IP67</p> <p>Output Function: NO / NO+NC</p> <p>Output Polarity: PNP / NPN</p> <p>Cable Length (mm): 2000, 5000</p> <p>Ordering Code: SGF3A-2000, SGF3A-5000, SGF4U-2000, SGF4U-5000</p> <p>SGF4 WITHOUT CABLE</p>

Connection Plug		
	<p>Technical Data: SWLF/SWTF</p> <p>Indication: -</p> <p>Environmental Protection: IP67</p> <p>Output Function: NO</p> <p>Output Polarity: PNP / NPN</p> <p>Cable Length (mm): 2000, 5000</p> <p>Ordering Code: SWLF3A-2000, SWLF3A-5000, SWLF3AP-2000P, SWLF3AP-5000P, SWTF3A-2000P, SWTF3A-5000P</p>	<p>Technical Data: SWLF/SWTF</p> <p>Indication: LED</p> <p>Environmental Protection: IP67</p> <p>Output Function: NO</p> <p>Output Polarity: PNP</p> <p>Cable Length (mm): 2000, 5000</p> <p>Ordering Code: SWLF3A-2000, SWLF3A-5000, SWLF3AP-2000P, SWLF3AP-5000P, SWTF3A-2000P, SWTF3A-5000P</p>
